Constructions realized in southern Brazil are very important characteristics of the specific region. All these spaces have the central role of accommodating the local population. The main function of these spaces is to provide shelter and protection from the elements, ensuring the safety and comfort of the occupants.

Our concept is to implement this idea, by creating a series of small, interconnected spaces between the buildings. These spaces are divided into a solid and an open area, allowing for easy access and movement between the buildings.

The space between the storage and the workshop becomes a workspace and a place to store tools in an open atmosphere. Thanks to the central court's placement, the space can be used as a sustainable environment for the community.

The dimensions and the layout of structural elements are consistent so that these can be used as storage shelves. The fully open nature of the space has been given by the geometric design, which allows for flexibility and adaptation. As a result, we have these types of flexible, versatile spaces, enhancing the overall interest and experience of the users.
